Engineers and Scientists Serving the Built and Natural Environments

LABORATORY TESTS OF AGGREGATE

Date: January 29, 1993

Project No: BFDX-92-017C
EP #93

Reported to: Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Copies to: Jim Martin

SAMPLE DATA:

Sample No: CC-670
Sampled By: MC
Date Sampled: 9/28/92
Proposed Use: Sand Blanket

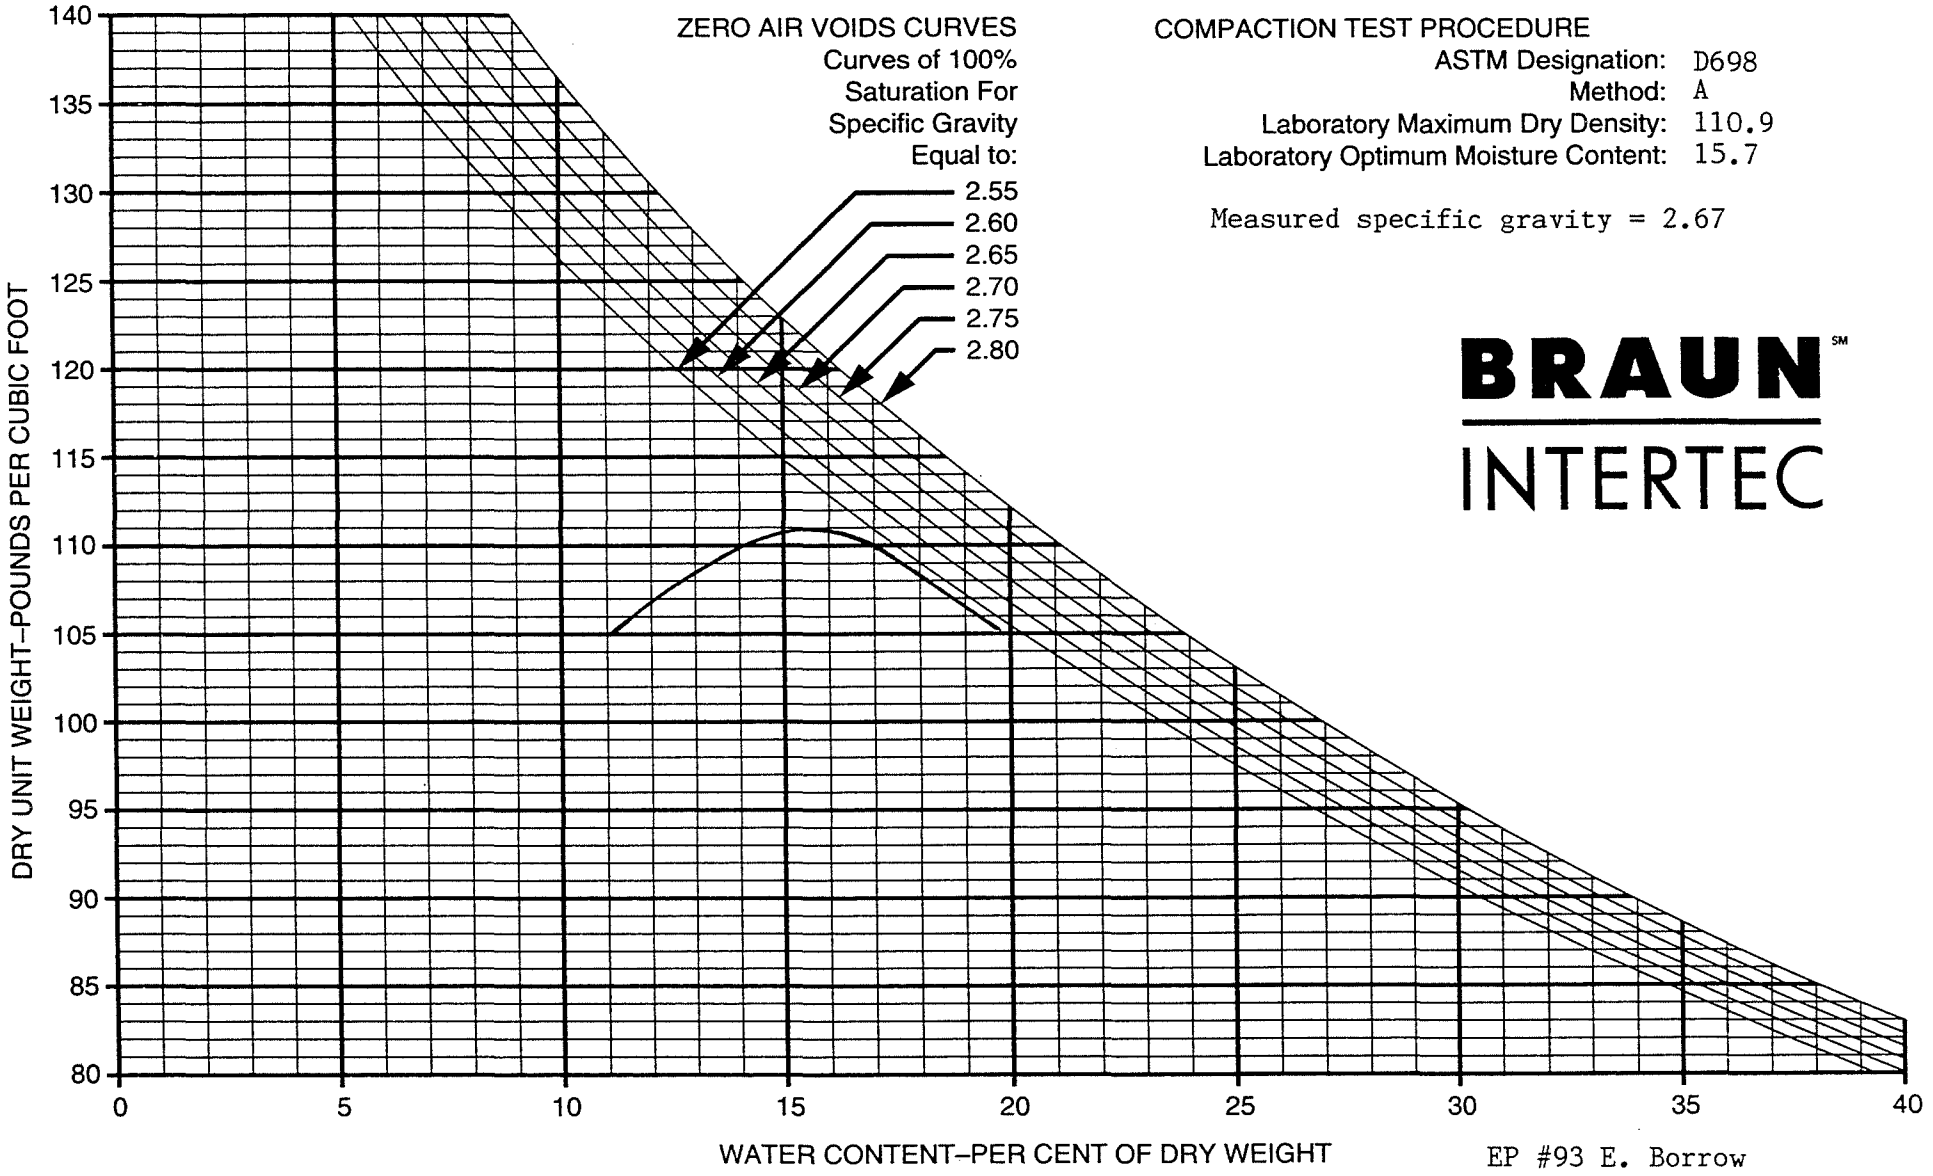
Location: EP #93
42800N 44600E

Date Received: 9/28/92

SIEVE ANALYSIS	% PASSING	SPECIFICATIONS
3/4"	100	100
#4	94	90-100
#8	82	-
#10	79	45-90
#20	65	-
#40	53	-
#50	47	15-45
#100	34	-
#200	27	0-15

PROPERTIES:

Shale & Soft Rock %:	-
L.A. Abrasion:	-
Plasticity Index:	-
Fractured Faces:	-



REMARKS:

BRAUN INTERTEC ENGINEERING, INC.

PERMEABILITY TESTS

DATE: August 12, 1992

PROJECT: BFDX-92-017C
EP #93

REPORTED TO:

Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

COPY TO: Jim Martin

SAMPLE DATA:

Boring Number	TP-4
Sample Number	CC-5
Location	43205N, 46390E
Type of Sample	Bag
Depth/Elevation	1-10
Soil Classification (ASTM D 2487)	Sandy Lean Clay (CL)

MOISTURE-DENSITY
Relation of Soil: ASTM D 698

Method	A
Max. Dry Density (pcf)	105.0
Optimum Moisture Content (%)	18.5

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Remolded
Dry Density (pcf)	101
Percent of Max. Density	96.2
Moisture Content (%)	20
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	3.7×10^{-8}

PERMEABILITY TESTS

DATE: August 13, 1992

PROJECT: BFDX-92-017C
EP #93

REPORTED TO:
Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

COPIES TO: Mr. Jim Martin

SAMPLE DATA:

Shelby Tube Number	ST-18A
Sample Number	CLS-CC-60
Location	43484N, 43996E
Type of Sample	Tube
Elevation	1898.3
Soil Classification (ASTM D 2487)	Sandy Lean Clay (CL)

MOISTURE-DENSITY Relation of Soil:

-

Method	-
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	107.1
Percent of Max. Density	N/A
Moisture Content (%)	17
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	5.2×10^{-8}

SAMPLE DATA:

Shelby Tube Number	35A
Sample Number	CLB-CC-176
Location	43367N 44117E
Type of Sample	Tube
Depth/Elevation	1888.2
Soil Classification (ASTM D 2487)	Sandy Lean Clay (CL)

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	108
Percent of Max. Density	N/A
Moisture Content (%)	20
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	1.4×10^{-8}

PERMEABILITY TESTS

DATE: January 29, 1993

PROJECT: BFDX-92-017C
EP #93

REPORTED TO:

Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

COPY TO: Jim Martin

SAMPLE DATA:

Shelby Tube Number	105A
Sample Number	CLB-CC-418
Location	43209N 44104E
Type of Sample	Tube
Depth/Elevation	1887.9
Soil Classification (ASTM D 2487)	Sandy Lean Clay (CL), olive brown

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	115.3
Percent of Max. Density	N/A
Moisture Content (%)	17.5
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	4.4×10^{-9}

Sample Number	CLB-CC-514
Location	43147N 44599E
Type of Sample	Tube
Depth/Elevation	1887.1
Soil Classification (ASTM D 2487)	CL

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	104.1
Percent of Max. Density	N/A
Moisture Content (%)	21.2
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	1.7×10^{-8}

Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

COPY TO: Jim Martin

SAMPLE DATA:

Shelby Tube Number	154A	154B
Sample Number	CLB-CC-571	CLB-CC-571
Location	43163N 45516E	43163N 45516E
Type of Sample	Tube	Tube
Depth/Elevation	1885.9	1885.9
Soil Classification (ASTM D 2487)	Sandy Lean Clay (CL)	Sandy Lean Clay (CL)

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head	Falling Head
Type of Specimen	Undisturbed	Undisturbed
Dry Density (pcf)	*	*
Percent of Max. Density	N/A	N/A
Moisture Content (%)	*	*
Max. Head Differential (ft)	3	3
Confining Pressure (effective-PSI)	4	4
Coefficient of Permeability (cm/sec)	*	*

REMARKS:

* Non-recoverable samples. Retested by CLB-CC-593.

SAMPLE DATA:

Shelby Tube Number	171A
Sample Number	CLB-CC-591
Location	43196N 44683E
Type of Sample	Tube
Depth/Elevation	1887.5
Soil Classification (ASTM D 2487)	CL

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	105.9
Percent of Max. Density	N/A
Moisture Content (%)	20.9
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	2.4×10^{-8}

COPY TO: Jim Martin

SAMPLE DATA:

Shelby Tube Number	186A
Sample Number	CLB-CC-644
Location	42780N 45305E
Type of Sample	Tube
Depth/Elevation	1883.5
Soil Classification (ASTM D 2487)	CL

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	101.5
Percent of Max. Density	N/A
Moisture Content (%)	21.2
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	1.4×10^{-8}

PERMEABILITY TESTS

DATE: December 29, 1992

PROJECT: BFDX-92-017C
EP #93

REPORTED TO:

Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

COPY TO: Jim Martin

SAMPLE DATA:

Shelby Tube Number	203A
Sample Number	CLB-CC-661
Location	42849N 45212E
Type of Sample	Tube
Depth/Elevation	1885.3
Soil Classification (ASTM D 2487)	CL

MOISTURE-DENSITY RELATION OF SOIL:

Method	ASTM D 698
Max. Dry Density (pcf)	N/A
Optimum Moisture Content (%)	N/A

PERMEABILITY TEST DATA:

Type of Test	Falling Head
Type of Specimen	Undisturbed
Dry Density (pcf)	109.4
Percent of Max. Density	N/A
Moisture Content (%)	18.3
Max. Head Differential (ft)	3
Confining Pressure (effective-PSI)	4
Coefficient of Permeability (cm/sec)	2.5×10^{-8}

REMARKS:

Permeability Tests

Date: March 18, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	N/A
Sample Number:	CC-258
Location	Stockpile N of EP #94
Type of Sample:	Bag
Depth/Elevation:	N/A
Soil Classification (ASTM D 2487):	(CH)

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	97.2
Optimum Moisture Content:	23.5

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Remolded
Dry Density (pcf):	92.5
Percent of Max. Density:	95.2
Moisture Content (%):	23.5
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	1×10^{-7}

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	52A
Sample Number:	CLS-CC-288
Location:	38993N 39725E
Type of Sample:	Tube
Depth/Elevation:	1905.7
Soil Classification (ASTM D 2487):	Fat Clay (CH)

Moisture-Density Relation of Soil:

Method:	ASTM D 698
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	100.5
Percent of Max. Density:	N/A
Moisture Content (%):	22.9
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4

Permeability Tests

Date: June 25, 1993

Project: BFDX-92-018C

Client:
Cooperative Power Association
Attn: Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	66A
Sample Number:	CLB-CC-313
Location:	37551N 39820E
Type of Sample:	Tube
Depth/Elevation:	1908.7
Soil Classification (ASTM D 2487):	Fat Clay (CH)

Moisture-Density Relation of Soil:

Method:	ASTM D 698
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	100.5
Percent of Max. Density:	N/A
Moisture Content (%):	23.4
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	2.1×10^{-8}

Remarks:

Permeability Tests

Date: February 15, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	98B
Sample Number:	CLS-CC-359
Location	38587N 39725E
Type of Sample:	Tube
Depth/Elevation:	1910.1
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), olive brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	109.4
Percent of Max. Density:	N/A
Moisture Content (%):	18.1
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	2.3×10^{-8}

Remarks:

Braun Intertec Corporation

cc: Jim Martin

Gerald L. Dauer, C.E.T.
Operations Supervisor

Permeability Tests

Date: February 16, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	TP-6
Sample Number:	CC-381
Location	40603N 42028E
Type of Sample:	Bag
Depth/Elevation:	1886.8
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), olive brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	101.0
Optimum Moisture Content:	20%

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Remolded
Dry Density (pcf):	100.5
Percent of Max. Density:	99.5
Moisture Content (%):	20.1
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	4.4×10^{-8}

Remarks:

Sample Data:

Shelby Tube Number:	TP-7
Sample Number:	CC-382
Location	40721N 41910E
Type of Sample:	Bag
Depth/Elevation:	1884.3
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), olive brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	96.1
Optimum Moisture Content:	24.5%

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Remolded
Dry Density (pcf):	95.6
Percent of Max. Density:	99.5
Moisture Content (%):	24.4

Permeability Tests

Date: February 16, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	ST-118B
Sample Number:	CLB-CC-402
Location	37830N 40000E
Type of Sample:	Tube
Depth/Elevation:	1906.4
Soil Classification (ASTM D 2487):	Lean Clay with Sand (CL), dark grayish-brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	104.2
Percent of Max. Density:	N/A
Moisture Content (%):	22.5
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	3.1×10^{-8}

Remarks:

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	ST-132A
Sample Number:	CLB-CC-430
Location	37995N 40833E
Type of Sample:	Tube
Depth/Elevation:	1901.1
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), olive brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	99
Percent of Max. Density:	N/A
Moisture Content (%):	24.6
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	1.6×10^{-8}

Remarks:

Permeability Tests

Date: February 18, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	ST-150A
Sample Number:	CLB-CC-448
Location	38518N 40018E
Type of Sample:	Tube
Depth/Elevation:	1903.1
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), olive brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	104
Percent of Max. Density:	N/A
Moisture Content (%):	22.2
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	1.8×10^{-8}

Remarks:

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	99.5
Percent of Max. Density:	N/A
Moisture Content (%):	21.9
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	3.4×10^{-8}

Permeability Tests

Date: February 22, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	ST-184A
Sample Number:	CLB-CC-494
Location	38692N 40044E
Type of Sample:	Tube
Depth/Elevation:	1902.3
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), very dark grayish-brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	104
Percent of Max. Density:	N/A
Moisture Content (%):	20.9
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	3.3×10^{-8}

Remarks:

Shelby Tube Number:	198B
Sample Number:	CLB-CC-514
Location	38334N 40761E
Type of Sample:	Tube
Depth/Elevation:	1900.0
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), very dark grayish brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	107.7
Percent of Max. Density:	N/A
Moisture Content (%):	20.5
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	1.8×10^{-8}

Remarks:

Date: March 29, 1994

Project: BFDX-92-018C

Client:
Cooperative Power Association
Mr. Andy Stewart
14615 Lone Oak Road
Eden Prairie, MN 55344-2287

Project Description:
Ash Pond #91

Sample Data:

Shelby Tube Number:	216A
Sample Number:	CLB-CC-538
Location	38322N 41252E
Type of Sample:	Tube
Depth/Elevation:	1898.9
Soil Classification (ASTM D 2487):	Sandy Lean Clay (CL), grayish brown.

Moisture-Density Relation of Soil:

Method: ASTM D 698*	
Max. Dry Density (pcf):	N/A
Optimum Moisture Content:	N/A

Permeability Test Data:

Type of Test:	Falling Head
Type of Specimen:	Undisturbed
Dry Density (pcf):	104
Percent of Max. Density:	N/A
Moisture Content (%):	21.5
Max. Head Differential (ft):	3
Confining Pressure (effective-PSI):	4
Coefficient of Permeability (cm/sec):	2.6×10^{-8}

Attention: Mr. Andrew W. Stewart P.E.
Manager, Plant Engineering and Construction

RE: GEOMEMBRANE QUALITY ASSURANCE SERVICES, POND 93, COAL CREEK STATION, UNDERWOOD, NORTH DAKOTA

Gentlemen:

Golder Construction Services, Inc. is pleased to present this report summarizing the quality assurance monitoring services performed for the installation of a geomembrane lining system at Pond 93, Coal Creek Station, Underwood, North Dakota. The quality assurance monitoring observations were performed from August 3, 1992 to September 23, 1992 and indicate that the installation of geomembrane liner for this effort is in substantial compliance with the specification guidelines and quality assurance program.

We appreciated the opportunity to work with Cooperative Power Association on this project. Should you have any questions or comments, please contact us.

Sincerely,

GOLDER CONSTRUCTION SERVICES, INC.

1.0 INTRODUCTION

1.1 Purpose

Golder Construction Services, Inc. (GCS) under contract to Cooperative Power Association (CPA) has performed quality assurance (QA) observation and conformance testing for the construction of a geomembrane liner at Pond 93 at the Coal Creek Station generating facility near Underwood, North Dakota. Specifically, this report provides a summary of our observations and testing associated with the installation of the geomembrane lining system installed over a two-foot thick compacted clay liner system. Quality assurance services during construction of the clay liner were performed independently by Braun Intertec of Bismarck, North Dakota, Inc.

1.2 Scope of Work

GCS was retained to provide full-time quality assurance services for installation of a geomembrane liner for Pond 93 at Coal Creek Station. Specifically, the GCS scope of services involved the following items:

- Provided full-time, on-site personnel to observe construction activities and verification that the completed work complied with the specifications and plans for the project.
- Verification that the materials used in construction were within the construction specifications as developed by the designer.
- Preparation of record documentation of the construction, including daily summary reports with supporting data sheets and record drawings of the geomembrane lining system.
- Preparation of this quality assurance report to summarize our observations and testing results.

Daily field observation reports were submitted to the lead monitor by all field personnel. The on-site lead monitor prepared weekly summary reports which were submitted to CPA. These reports are not included in this document, but are available for review in the projects files at Golder Construction Services, Inc., 200 Union Boulevard, Suite 100, Lakewood, Colorado, and at Coal Creek Station.

1.3 Project Team/Work Schedule

The project team typically consisted of a lead monitor, two monitors from GCS and two to three monitors provided by CPA. The total number of QA monitors typically varied from three to four as required by the installer's level of effort. When available, QA monitors were utilized to enter monitoring data into an on-site computer and generate the record drawing for the final report preparation. The lead monitor or a designated QA monitor was on-site at all times during the installation process. QA monitoring by GCS began on August 3, 1992. The geomembrane installation was complete on September 23, 1992. The installer (Gundle Lining Systems) typically worked an 8 to 10-hour shift, six days per week. A listing of the GCS and installation personnel and their initials used on field and summary documentation is contained in Appendix A. Destructive testing services were performed by Braun Intertec Engineering, Inc. (Braun) of Bismarck, North Dakota.

2.0 PROJECT SPECIFICATIONS

The geomembrane materials were installed under the following documents: Section 02450 of the project specifications, National Sanitation Foundation Standard 54 (May 1991) and the Gundle Quality Assurance Manual for the Installation of Polyethylene Lining Systems.

3.0 IN-PLANT MONITORING OF GEOMEMBRANE MATERIALS

3.1 General

A total of approximately 6,750,000 square feet of 40 mil high-density polyethylene (HDPE) was manufactured in 1992 for Ponds 91 and 93 and shipped to the site in North Dakota. However, only Pond 93 was constructed in 1992. The geomembrane liner used in Pond 93 consisted of approximately 2,925,500 square feet of 40 mil HDPE. The material was manufactured by Gundle Lining Systems Inc. of Houston, Texas. Monitoring of all 6,750,000 square feet of the 40 mil HDPE geomembrane production was performed by GCS at the Gundle manufacturing facility in Houston, Texas. The plant monitoring was authorized by CPA to provide documentation that the geomembrane met the project specifications prior to shipment to the site. Gundle manufactured the rolls on an intermittent basis between March 23, 1992 and April 9, 1992. GCS performed monitoring on a part-time basis.

3.2 Scope of Work

The following monitoring items were performed and documented by GCS during the plant visits.

- Spot thickness measurements were obtained on rolls produced during GCS plant visits.
- Thickness measurements performed by Gundle on rolls produced while GCS was not at the plant were reviewed.
- The condition of the sheet was visually observed for defects including dimples, creases, undispersed raw materials, etc.
- Date and time of roll manufacturing were documented.
- Inventory of rolls accepted and rejected by roll number was documented.

- Gundle Geomembrane Quality Control, Geomembrane Quality Assurance and Resin Quality Control Certificates for the accepted rolls were obtained and reviewed for conformance to the project specifications.

- GCS selected rolls for conformance testing. Conformance samples were subsequently cut and sent to the GCS geosynthetics laboratory in Atlanta, Georgia.

The total number of rolls approved for shipment to the construction site was 301. Appendix B presents the In-Plant Geomembrane Roll Quality Assurance Records for all rolls produced for Ponds 91 and 93.

3.3 Results

The GCS monitor was at the plant on a part-time basis during production of the geomembrane rolls produced for Ponds 91 and 93. Therefore when GCS was at the plant, a portion of the rolls were approved or rejected by GCS and Gundle, and the remainder of the rolls were approved or rejected solely by Gundle when GCS was not at the plant.

For approved rolls, all spot thickness measurement met the project specifications and no major defects were observed during visual monitoring of the sheet during production. Each roll measured 34.5 feet wide by approximately 650 feet long. The base resin materials used during manufacturing were supplied by Quantum Chemical Corporation, Solvay Polymers, and Chevron Chemical Company.

Quality control (QC) documentation submitted by the manufacturers for the geomembrane used on the project is presented in Appendix C. This appendix contains the resin manufacturer's QC documentation that relates the rail car shipments of resin with the geomembrane manufacturer's panel QC certificates and to specific geomembrane roll numbers. Section 1 within Appendix C contains all pertinent Gundle QC/QA documents. Section 2 within Appendix C contains all pertinent resin manufacturer's QC documents.

The geomembrane manufactured for Ponds 91 and 93 was tested by the GCS geosynthetics testing laboratory in Atlanta, Georgia, to verify conformance with the project specifications. Conformance test samples were selected by GCS QA personnel and removed by Gundle at the manufacturing plant at a frequency of approximately one per 100,000 square feet of geomembrane material delivered to the project.

All materials were tested for material characteristics outlined in Section 2.03 of the project specifications using ASTM standard test procedures. Test reports were submitted to the GCS plant monitor for review.

Approximately 6,750,000 square feet of HDPE geomembrane were manufactured for Ponds 91 and 93. A total of 69 rolls of HDPE geomembrane were sampled and tested for conformance with the specifications. This resulted in a testing frequency of one test per 97,800 square feet of deployed geomembrane. All of the tests indicated conformance with the material properties specified except for one portion of one test on roll 06010783. Ten specimens from this roll were tested for break strength -- five in the machine direction and five in the transverse direction. One test in the transverse direction had a value of 129.6 ppi which was lower than the minimum specified value of 158 ppi.

This roll was approved for use since it was believed that this test result would not compromise the integrity of the liner and the roll was used on the project for the following reasons:

- Test results on all other portions of the 69 samples met the specifications;
- Four out of the five tests and the average of the five tests for break strength in the transverse direction for the roll in question met the specified value; and
- The break strength of one specimen is of minor concern since the yield strength for this specimen met the specified value. The yield strength of this roll would be sufficient to maintain

the integrity of the liner up to the designed yield value and thus the break strength of one specimen should be of minor concern assuming the yield strength should never be mobilized.

Geomembrane conformance test results are presented in Appendix D.

4.0 GEOMEMBRANE MONITORING PROCEDURES

The quality assurance activities performed by GCS for geomembrane installation included:

- Observation of geomembrane deployment procedures;
- Observation of trial seam procedures and evaluation of test results;
- Observation and documentation of field seams and seaming operations;
- Identification and documentation of defects and observation of repairs;
- Location of seam strength destructive tests and evaluation of test results; and,
- Observation and documentation of non-destructive seam continuity testing.

A detailed description of each of the above activities is presented in the following sections.

4.1 Geomembrane Deployment Monitoring

Geomembrane panels were visually monitored by GCS personnel as they were deployed from the roll into position on the subgrade. This process required the monitoring of subgrade conditions, sheet anchoring, sheet alignment, sheet overlap with adjacent panels, panel extensions into anchor trenches, sheet surface quality and sheet thickness. Each deployed geomembrane panel was assigned a unique identification number by an GCS monitor and each panel was visually monitored for damage and/or manufacturing imperfections. Defects were marked and documented by GCS monitors and subsequently repaired by the installer.

GCS observed the subgrade surface preparation prior to deployment of the geomembrane for protrusions and deleterious material. Subgrade preparation was performed by Blattner Construction Company using a motor grader and a smooth drum roller. Where necessary,

manual work, such as picking up rocks and clods and filling voids, was then carried out before the subgrade was accepted for installation of the geomembrane by the installer.

Subgrade acceptance certificates for Pond 93 were submitted by the installer and are presented in Appendix E. Surveying was performed by Interstate Engineering to ensure that design lines and grades were achieved prior to geomembrane deployment.

Deployment of each of the HDPE panels was performed by use of a rubber tired front-end loader. A GCS monitor visually monitored each panel as it was deployed. In addition, sheet thickness measurements along each end and on one side of each panel were made and recorded to confirm that the geomembrane used on the project was 40-mil HDPE liner and within project specifications. After deployment, the installer placed loads of sandy cover material with a front end loader and sand bags along panel edges as a temporary loading measure until the panels were joined by fusion welding. Sandbags were similarly used to temporarily secure panels which extended into the anchor trenches. HDPE, which extended into the anchor trench a minimum of 5 to 6 feet, was subsequently secured with clayey backfill.

Geomembrane used on the project was observed to contain some minor handling defects. Geomembrane blemishes, factory defects or areas damaged during deployment were marked by GCS personnel for subsequent repair.

A summary of abbreviations used by the GCS monitors during construction is presented in Appendix F. Tables summarizing the monitoring during deployment of the geomembrane panels are presented in Appendix G. A record drawing of the panel layout for the geomembrane liner is presented in Figure 1.

4.2 Geomembrane Test Seam Monitoring

Test seams were performed as a means of monitoring the performance of the seaming apparatus and operator under actual site conditions. Geomembrane test seams were performed prior to the beginning of each day's seaming operation and at mid-day intervals during the seaming period. Each test seam was sampled and tested twice for peel adhesion (peel) and once for bonded seam strength (shear), with the untested portion of each sample retained for the archives of CPA at Coal Creek Station. Test seam summaries are presented in Appendix H. Destructive sample test codes for extrusion and fusion seaming are presented in Figures 2 and 3, respectively.

4.3 Geomembrane Seaming Procedures and Observations

The principal seaming methods for this project were the Gundle double fusing welding and the manual extrusion process. Seaming operations were observed by the GCS QA monitors on a full-time basis. All seams were inspected for visual quality and seam completion. Monitoring of the seaming techniques consisted of visual observation of trial seam tests, monitoring ambient and seaming equipment temperatures, monitoring speed of seaming equipment, and continuous visual observation of completed seams. Personnel performing the seaming and the equipment used were recorded during monitoring for tracking purposes in the event of a destructive test failure. Weld imperfections were marked by GCS and were subsequently repaired by the installer in accordance with the specifications and Gundle QA manual. Field test seams were typically made twice daily for each welder and piece of seaming equipment to evaluate equipment and operator performance. Geomembrane seam inspection summaries are presented in Appendix I (Fusion Welding) and Appendix J (Extrusion Welding is presented on the geomembrane repair summary).

4.4 Geomembrane Defect and Repair Observations

Geomembrane panels were initially observed, as previously stated, for damage during transportation or deployment. All panels and seams were repeatedly observed for defects until the cover material was placed over the geomembrane layer.

Each defect was documented, assigned a unique identification defect code, marked for repair by GCS on the geomembrane and subsequently repaired by the installer. Summaries of defects and non-destructive testing of repairs, including the approximate location of each repair, are presented in Appendix J.

4.5 Seam Strength Destructive Testing

In accordance with the specifications, seam strength destruction test samples were taken at a minimum frequency of one sample per 500 linear feet of seam. Test locations were selected by the GCS QA monitors based on either the completion of approximately 500 feet of welded seam by a given welding machine and/or welder, working conditions, or a suspicion of a defective weld. In the event of a failing sample, the path of the welder or welding machine was traced in each direction from the failed destructive location at approximately 10-foot intervals. The failing seam would then be bounded by passing destructive tests or the entire seam would be reconstructed. If the first alternative was adopted, the welder's path was capped with another layer of 40 mil HDPE then extrusion welded between the two passing locations. If the second alternative was adopted, the seam was then reconstructed by extrusion welding the outside track of the fusion weld. The location of each destructive test is shown on the record drawing (Figure 1) and the location identified on defective repair logs (Appendix J).

For extrusion welded samples, 6 specimens were removed for destructive testing. Five of the specimens were tested for peel with acceptance criteria being that 5 of the 5 specimens should have a yield strength at least 52 ppi and fail in a film tear bond (FTB) mode. The other

5 specimens from each sample were tested for shear with the acceptance criteria being that 5 out of 5 specimens from each sample must have yield strengths of at least 80 ppi and fail in a FTB mode. For double fusion welds, the above procedures were also followed for destructive testing with the peel tests performed on the inside weld track for 201 specimens. The acceptance criteria for fusion welded test specimens were the same as extrusion welded test specimens.

All destructive sample tests were performed by Braun. Braun reported test results as FTB or peel also listing maximum load achieved before sheet failure.

Destructive sample testing was also performed by Gundle laboratories on each sample. If a destructive test sample failed at either lab, the sample test was considered failing, and the seam or seam section was reconstructed or capped. Summaries of destructive sample test results are presented in Appendix K.

4.6 Non-Destructive Seam Continuity Testing Observations

All non-destructive seam continuity testing was performed by the installer, Gundle Lining Systems, and visually observed by GCS personnel on a full-time basis to verify completeness of the non-destructive testing and the continuity of the tested seam. Two types of non-destructive testing were utilized: vacuum box testing on extrusion welding and air pressure testing on the double fusion welding.

Summary tables of air pressure testing are presented in Appendix L. Vacuum box test results are presented on the geomembrane repair summaries in Appendix J. Dates of the non-destructive testing of each repair are included in the geomembrane repair summaries presented in Appendix J. Any defects located during non-destructive testing were repaired by the installer and retested.

5.0 SUMMARY

GCS was retained by Cooperative Power Association to provide geomembrane material quality assurance monitoring services during the construction of Pond 93 at the Coal Creek Station generating facility near Underwood, North Dakota. The installation of the geomembrane liner was monitored by GCS personnel from August 3, 1992 through September 23, 1992.

The geomembrane installation quality assurance program included monitoring of: geomembrane deployment, trial seaming, field seaming, non-destructive seam continuity testing, seam strength destructive test results, and geomembrane repair procedures.

The observations made by GCS during the monitoring of the geomembrane material installation during construction of Pond 93 indicated that the installation was performed in substantial compliance with the specification guidelines and quality assurance program for this project.
